

training data X

1. FIT

Gaussian mixture,
full covariances
EM over 157 PCs $\rightarrow \mu_k, \Sigma_k, \pi_k$

2. SELECT

Rank all m training rows
by distance to μ_k ; keep
the nearest ϕm of them

3. WEIGHT

Mixture posterior of query x^*
 $\gamma_k(x^*) \propto \pi_k \mathcal{N}(x^* | \mu_k, \Sigma_k)$
— carries the full Σ_k

six overlapping
training subsets
(42% pairwise
overlap at $\phi = 0.5$)

one base learner f_k per subset
 $P(y|x^*) = \sum_k \gamma_k(x^*) P_k(y|x^*)$
